Application of K-Means Clustering on Cricket Match Toss and final results to find any correspondence

Overview

We have often seen cricket matches, either at home in the comfort of the television screen or in a cricket stadium. Often after the toss, the winning team chooses to either bat or field, and we as a general spectator often speculate about the consequences of such a decision. Often, we also bombard our mind with questions like, will the toss-winner become the match winner too? Is luck in their favour? Here, I have taken up some real time data to see if the toss winning has some effect on match winning in a direct sense, or it's just merely a speculation.

Data Source

The data was sourced from a public GitHub repository of '*akpythonyt*'. The link to the publicly accessible raw data is enclosed below

<https://github.com/akpythonyt/Datasets/blob/main/matches.csv>

Understanding the Data

The names of the columns and the meaning of the data they contain are presented herewith.

id - Serial numbering the rows

season - year in which the match was played

city - City in which the match was played

date - Date of the commencement of the match

team1 - First competitor in the match

team2 - Second competitor of the match

toss_winner : Team which won the toss

toss_desicion : The decision taken by the toss winning team, to either bat or bowl

result : match won by how many runs or how many wickets; or draw match

dl_applied : if any dl was applied, indicated by the number

winner : The winning team

win_by_runs : by how many runs did the winning team win

win_by_wickets : by how many wickets did the winning team win

player_of_match : the man of the match declared

venue : the name of the stadium where the match was played

umpire1 : Name of the first umpire

umpire2 : Name of the second umpire

umpire3 : Name of the third umpire

Creation of the dataset

```
import pandas as pd
df =
pd.read_csv('https://raw.githubusercontent.com/akpythonyt/Datasets/main/matches
.csv')
#sourced the data from -
https://github.com/akpythonyt/Datasets/blob/main/matches.csv
```

Working on the Data

Now we shall modify the data as per the necessity of the work. We shall also remove certain columns in the dataset as they are not of the concern for the present study.

```
import numpy as np
team_uni = np.array(df['team1'].unique())

df = df.drop(columns =
['season', 'city', 'date', 'toss_decision', 'result', 'dl_applied', 'win_by_runs', 'wi
n_by_wickets', 'player_of_match', 'venue', 'umpire1', 'umpire2', 'umpire3'])
#deleted unnecessary columns

#eliminating empty rows for the data
df =df.dropna()
```

The resulting data after dropping the certain columns as seen in the second block and deleting null valued rows, has 5 columns and 762 rows.

The data,after all these modifications; look like

id	team1	team2	toss_winner	winner
1	Sunrisers Hyderabad	Royal Challengers Bangalore	Royal Challengers Bangalore	Sunrisers Hyderabad

Now we work on putting mathematical values to data, since there are 14 unique teams that could be found, so we number the various teams like that and modify the values and put them in a new dataframe

Team name	Number assigned
Sunrisers Hyderabad	0
Mumbai Indians	1
Gujarat Lions	2
Rising Pune Supergiant	3
Royal Challengers Bangalore	4
Kolkata Knight Riders	5
Delhi Daredevils	6
Kings XI Punjab	7
Chennai Super Kings	8
Rajasthan Royals	9

Deccan Chargers	10
Kochi Tuskers Kerala	11
Pune Warriors	12
Delhi Capitals	13

```

t1 = np.array(df['team1'].values)
t2 = np.array(df['team2'].values)
t_win = np.array(df['toss_winner'].values)
win = np.array(df['winner'].values)

#team_uni contains the names of the teams uniquely
for i in range(752):
    for j in range(14):
        if t1[i] == team_uni[j]:
            t1[i] = j
        if t2[i] == team_uni[j]:
            t2[i] = j
        if t_win[i] == team_uni[j]:
            t_win[i] = j
        if win[i] == team_uni[j]:
            win[i] = j

```

Other than this, a new column, **Pred** is created which stores values as follows

Type	Value assigned
Toss winner won the match	1
Toss winner did not win the match	0

```

arr_res = []
for i in range(752):
    if t_win[i] == win[i]:
        arr_res.append([t1[i],t2[i],t_win[i],win[i],1])
    else:
        arr_res.append([t1[i],t2[i],t_win[i],win[i],0])
arr_res

```

```
df2 = pd.DataFrame(columns =
['Team1', 'Team2', 'Toss_winner', 'Match_winner', 'Pred'], data = arr_res)
```

df2 contains the same data as df, but with the mathematical substitution as mentioned in the table above. Now we make the input column for the clusterer.

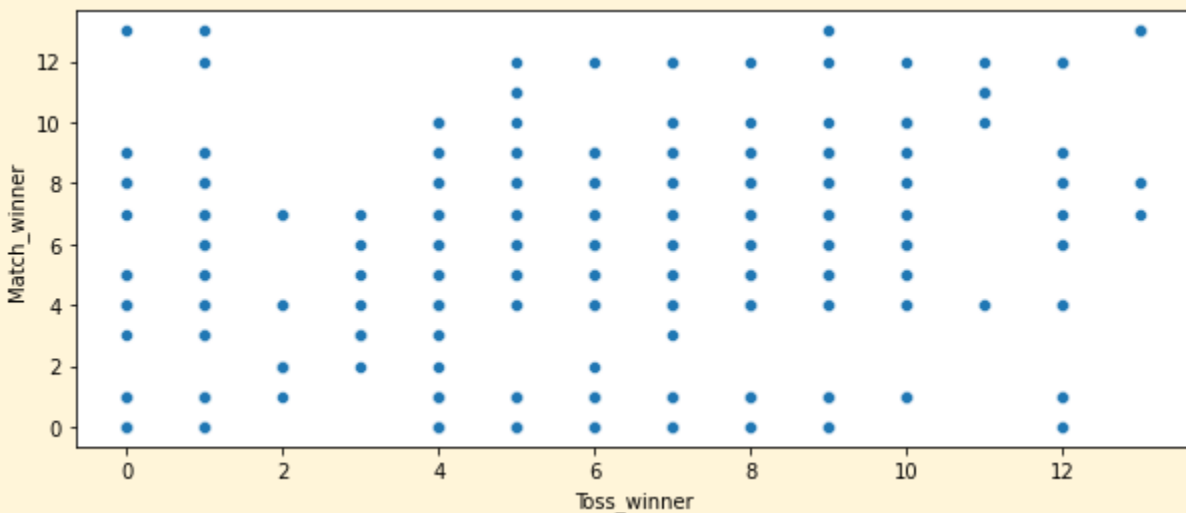

```
x=df2.iloc[:,2:4].values    #input
```

Here, we have decided to have two clusters, toss won as well as match won, toss won but match not won. So we are not applying any elbow and silhouette scoring method to find the best possible number of clusters.

However, before applying our clusterer, we would make an attempt to visualise our data.

```
#initial visualisation, before clustering
import matplotlib.pyplot as plt
import seaborn as sns
plt.figure(figsize = (10,4))
sns.scatterplot(df2['Toss_winner'],df2['Match_winner'])
```

Its output was yielded as

Now we dive straight into application of the K-Means clustering.

```
#Here I fix the number of clusters to be 2
#now I use clusterer
from sklearn.cluster import KMeans
```

```

model = KMeans(n_clusters = 2, random_state = 0) # there are two clusters,
toss won and match won, toss won and match lost
model.fit(x)
y=model.predict(x) #output

```

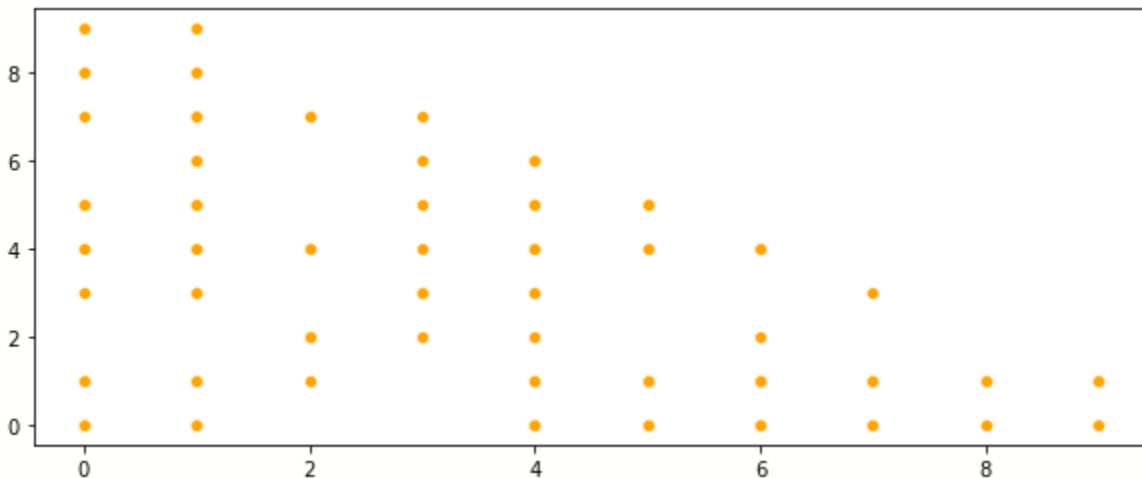

Now that we have the output in hand, we would visualise how things are

```

#visualisation
import matplotlib.pyplot as plt
import seaborn as sns
plt.figure(figsize = (10,4))
for i in range(1,2):
    sns.scatterplot(x[y==i,0],x[y == i,1],color='orange')

```

Here I try to visualise the matches where the toss winner won the match using orange colour.

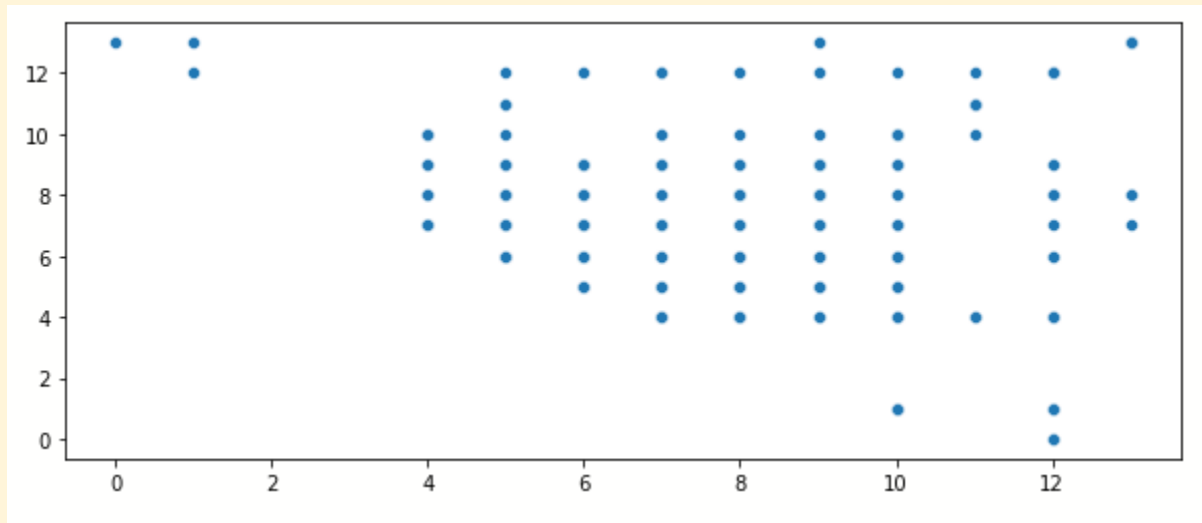

Now, I try to visualise the matches where the toss winner did not win the match using deep blue colour.

```

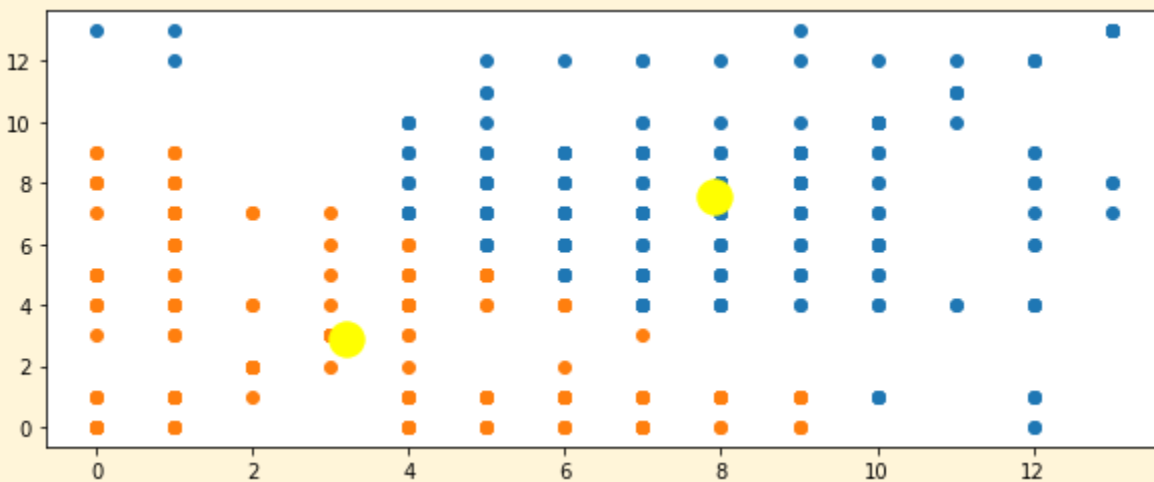

#visualisation
import matplotlib.pyplot as plt
import seaborn as sns
plt.figure(figsize = (10,4))
for i in range(0,2,2):
    sns.scatterplot(x[y==i,0],x[y == i,1])

```

Now we are in a position to visualise the entire data in two clusters, as follows. We shall also mark their centroids with yellow dots.

```
import matplotlib.pyplot as plt
import seaborn as sns
plt.figure(figsize = (10,4))
for i in range(2):
    plt.scatter(x[y==i,0],x[y == i,1],label = f'Cluster {i}')
plt.scatter(model.cluster_centers_[0],model.cluster_centers_[1],s= 300,c =
'yellow',label = 'centroids')
```

From this graph, we can clearly see that we can distinguish the two clusters by using a straight line, which is left to the visual realisation of the reader. The centroids marked are for conveniently observing the centres of the clusters.

Inference and conclusive remarks

When we start to visualise the clustered data, we can see the centroids of the data classified by K-Means. And from the applied classification, it was seen that contrary to the popular saying, it might not be the fact that the toss winner becomes the match winner. Rather, our data seemed to point that rather the contrary is true in this case. However, such a conclusion is not absolute, neither the data set we have here is exhaustive. It is always possible for a bigger set of data the clusters come up in a different way, justifying the popular belief. So from this, it was not possible to clearly come to any direct correlation between the toss winning by a certain team and the match being won by them.

However, it is to be noted that such a K-means clustering project can be a prototype for a larger scale project considering more intricate factors and larger dataset for coming to accurate conclusions.
